

Multi-Cloud DevOps PaaS

for IT Departments

Familiar Problems?

Complex Management
and High TCO

Long Time to Market &
Slow Product Upgrades

Difficult Migration Flow
to Cloud & Containers

Limits in Data Location
due to Security Reasons

Turnkey PaaS for Solving Various Problems

MULTI-CLOUD PAAS

Turnkey platform with high availability across regions and clouds within one panel

MANAGED AUTO-CLUSTERING

Prepackaged auto-clustered templates require minimal involvement

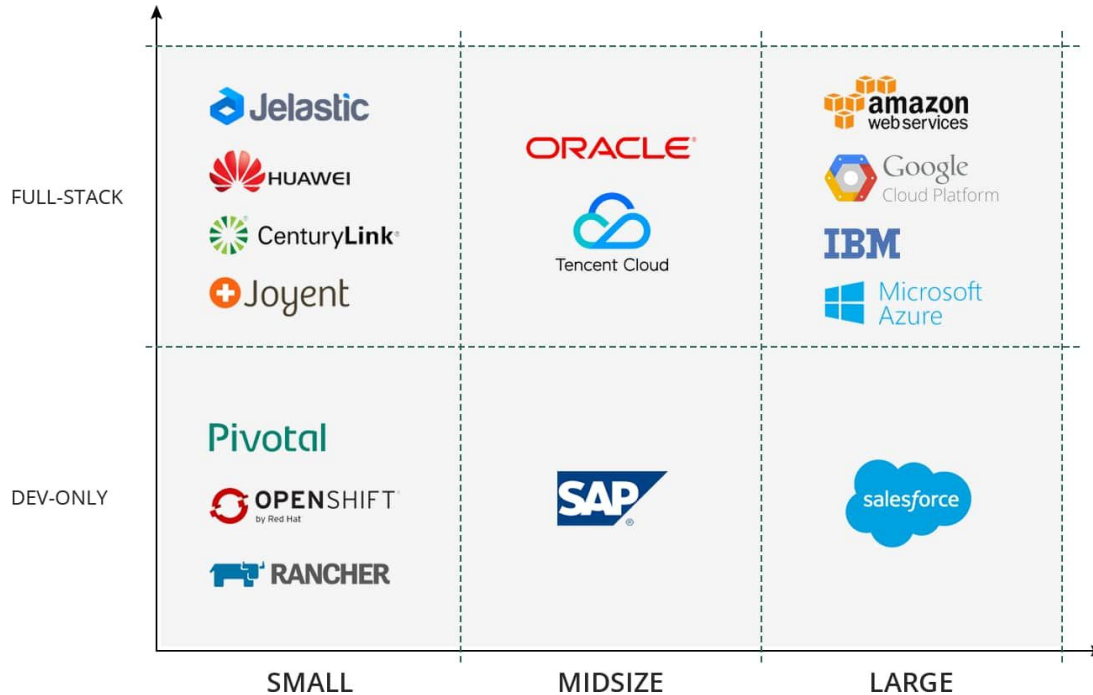

MULTI-TENANT DOCKER HOSTING

Advanced Container as a Service solution for Docker based projects

AUTO-SCALABLE VPS

Virtual Private Server automatically scaled vertically and horizontally

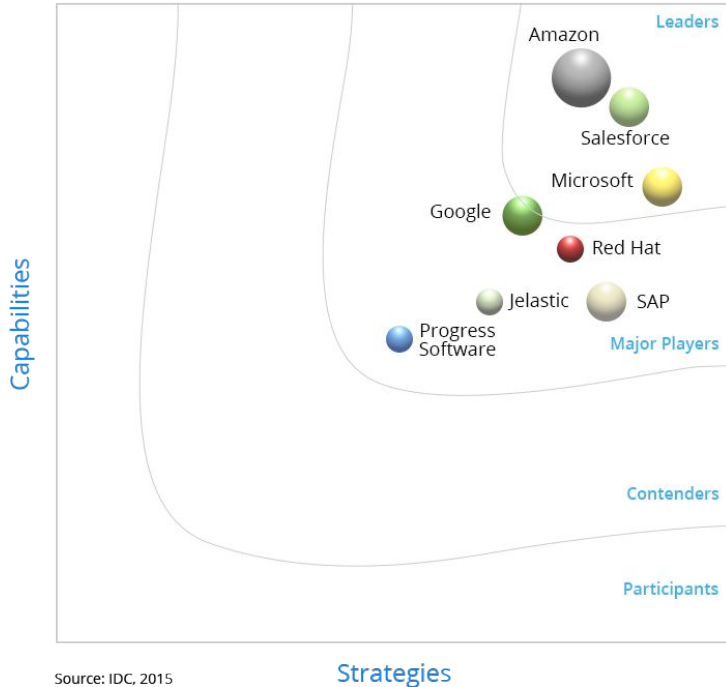

Jelastic is a Major Player in the Cloud Market

Forrester listed Jelastic along with AWS, Microsoft Azure and Google Cloud as a full-stack cloud platform provider that gives developers deep control over their application architectures, offers runtimes for projects written in various languages, DevOps toolchains, CaaS, database and analytics services, and many more.

Jelastic is a Major Player in the Cloud Market

IDC MarketScape Public Deployment-Centric Cloud Application Platform Market

Source: IDC, 2015

“Jelastic thrives on flexibility for partners and customers offering wide choice of programming languages, Docker containers orchestration, datacenter distribution of workloads within hybrid cloud, and automation of the main DevOps processes. Jelastic has rich container adoption and high level of DevOps automation. Partners liked Jelastic's ease of self-provisioning and worldwide support.”

“We like that Jelastic is riding the wave of IaaS-PaaS convergence, rather than struggling against it. The company has already proven that it can support large service providers that want to build applications and services on top of its IaaS-PaaS combination.”

Eliminate Configuration Complexity

Simple, Intuitive and Functional Platform

The thing that makes me pull away from Google App Engine and Amazon Web Services is Jelastic user interface: makes life easy for me and my team whereas those other UIs are just terrible. It's too much hard work to use those platforms and in Jelastic we just know how it works. So it makes a big big difference for us.

[Paul de Villiers](#) BlueBox

Jelastic has become the most crucial choice of solution for us. When a customer wants to host his informational system, we systematically offer him this platform. [The management interface is also to quote: simple, intuitive and functional.](#)

[Simon Lee](#) Atout Persona

The ease-of-use of the Jelastic control panel: it is simple and easy but extensive enough to control instances in the clear user interface, and they also offer the possibility for more advanced controls via SSH connection. When we were comparing with competitors, they offered only user interface controls or SSH terminal based controls, not both, as Jelastic does.

[Esko Kantola](#) FA Solutions

Jelastic allowed us to host the project in a simple way with total cost control. [I do not think there is yet another alternative PaaS for Java applications like Jelastic, that is so easy to understand and use, cost-effective, and efficient for projects that do not have the continuous intensive load.](#)

[Paolo Urbanetto](#) Maggioli

Rich and Intuitive Web UI

The screenshot displays the Jelastic web interface. At the top, there are navigation links for 'NEW ENVIRONMENT', 'IMPORT', and 'MARKETPLACE'. The user's account information 'CLOUD@JELASTIC.COM' and a balance of '\$40771.84' are visible in the top right. The main content area shows a table of environment groups:

Name	Status	Tags	Usage
Magento Cluster magentocloud.jelastic.com	Running	Magento Clusters	2% 4/16
nodejscloud nodejscloud.jelastic.com	Running	Node.js cloud servers	14% 1/8
Spring Boot App springbootapp.jelastic.com	Running	Java Cloud Applications	2% 8/48
Ubuntu 16 ubuntu.jelastic.com	Running		2% 3/88
Wordpress Autoscaling wordpressscale.jelastic.cloud	Running	WordPress Clusters	2% 4/16

Below the table, there are tabs for 'Archive' and 'Git / SVN'. An 'Add Project' section contains a list of projects with their names and URLs:

Name	URL
SpringBootApplication	https://github.com/jelastic/spring-boot-sample-jelastic
Alfresco	https://github.com/Alfresco/alfresco-server-root
Mangeto_2_2	https://github.com/magento/magento2
WordPress	https://github.com/WordPress/WordPress

At the bottom, there is a status bar showing 'No active tasks' and a 'Deployment Manager' icon.

Jelastic is Fantastic

The screenshot displays the Jelastic cloud management interface. At the top right, the JavaOne logo is visible. The main dashboard shows a table of running instances with columns for Name, Type, and Usage. Below this, there is an 'Upload' section with a table of applications.

Name	Type	Usage
java-1080p-60.00Hz	Running	1%
java-1080p-60.00Hz	Running	22%
java-1080p-60.00Hz	Running	4%
java-1080p-60.00Hz	Running	12%
java-1080p-60.00Hz	Running	9%

Name	Comment	Size	Upload date
java-1080p-60.00Hz	Java Tracker: JRE Application	480 KB	03-02 13 Sep 2017
java-1080p-60.00Hz	Generic package which you can deploy to your environment. Feel free to add...	480 KB	03-02 21 Aug 2017

Father of Java Loves Jelastic

The slide features a diagram of a network topology with five nodes (circles) and several bidirectional arrows. The nodes are arranged in a diamond shape with a fifth node at the bottom. The top node is connected to the left and right nodes. The left and right nodes are connected to each other. The left and right nodes are connected to the bottom node. The bottom node is connected to the right node. The diagram is labeled with 'Span Datacenters & ISPs' in the top left, 'Use no ISP special APIs' in the bottom left, 'JElastic' between the top and left nodes, 'Entic' between the right and bottom nodes, and 'GoGrid' below the bottom node. In the top right corner, there is a logo for 'marakana TechTV'. In the bottom right corner, there is a small video inset showing a man standing on a stage.

Auto-Scalable WordPress Cluster

WordPress Cluster ★

Get your highly available and scalable clustered solution for WordPress, the extremely popular open source CMS and blogging tool. This package is designed to ensure the load tracking and distribution, as well as automatic adjusting the amount of allocated resources according to it.

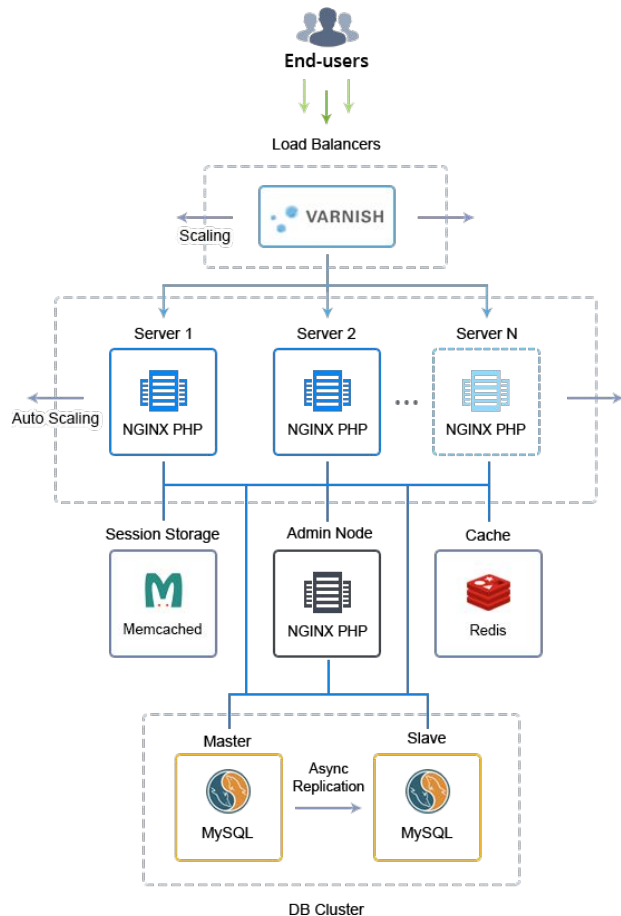

WP Title: HelloWorld

Environment: WordPress-Clustering ✓ .jelastic.com

Display Name: WordPress Cluster

Region: US-West

Cancel Install

Auto-Scalable Magento Cluster

Auto-Scalable Magento Cluster ★

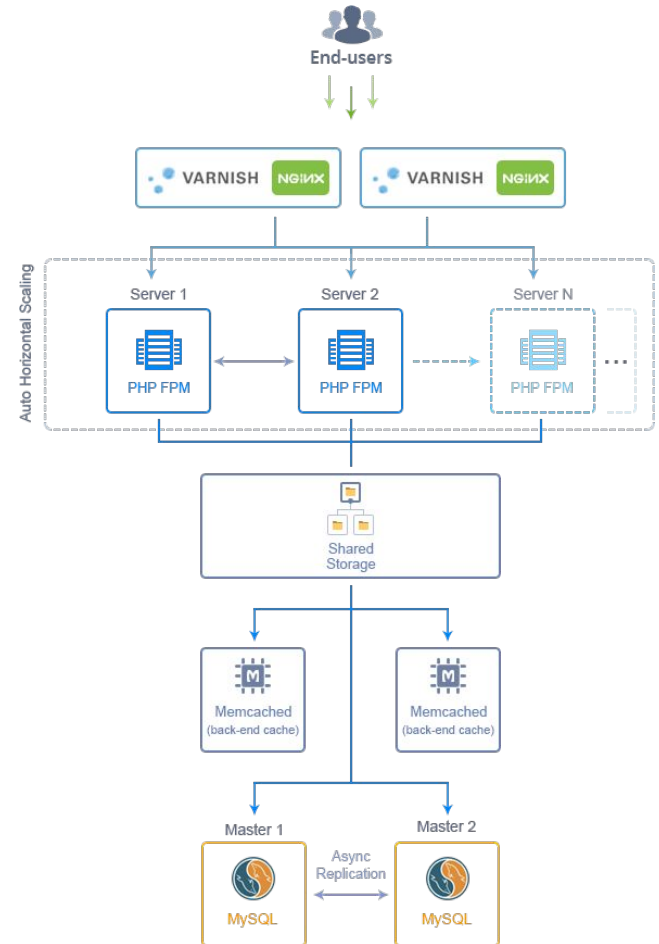

Auto-scalable and highly-available Magento eCommerce cluster with out-of-box auto-scaling, even load and traffic distribution, master-slave data replication, page caching and user session storage, run in Docker containers.

More info at <https://github.com/jelastic-jps/magento/tree/master/magento19-php7-varnish-mysql-redis-storage>

Environment: **Magento-Clustering** ✓ .jelastic.com

Display Name: **Auto-Scalable Magento Cluster**

Region: **US-West**

MySQL Auto Clustering

MySQL Auto Clustering

 Pre-configured and ready-to-work MySQL Cluster with master slave asynchronous replication. By default, the cluster consists of one master and one slave container. The number of slaves can be increased stating more containers below.

Cluster Mode

- Master - Slave x N
- Master - Master
- MGR - Single Primary Cluster
- MGR - Multi Primary Cluster
- Galera

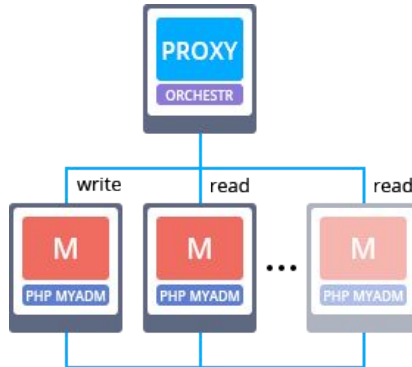

Environment ✓

Display Name

Region

- Master-Slave with automatic addition of extra slaves
- Master-Master with extra slave DBs
- Single MySQL Group Replication with extra master DBs with read rights
- Multi MySQL Group Replication with extra master DBs with write rights
- Galera Cluster

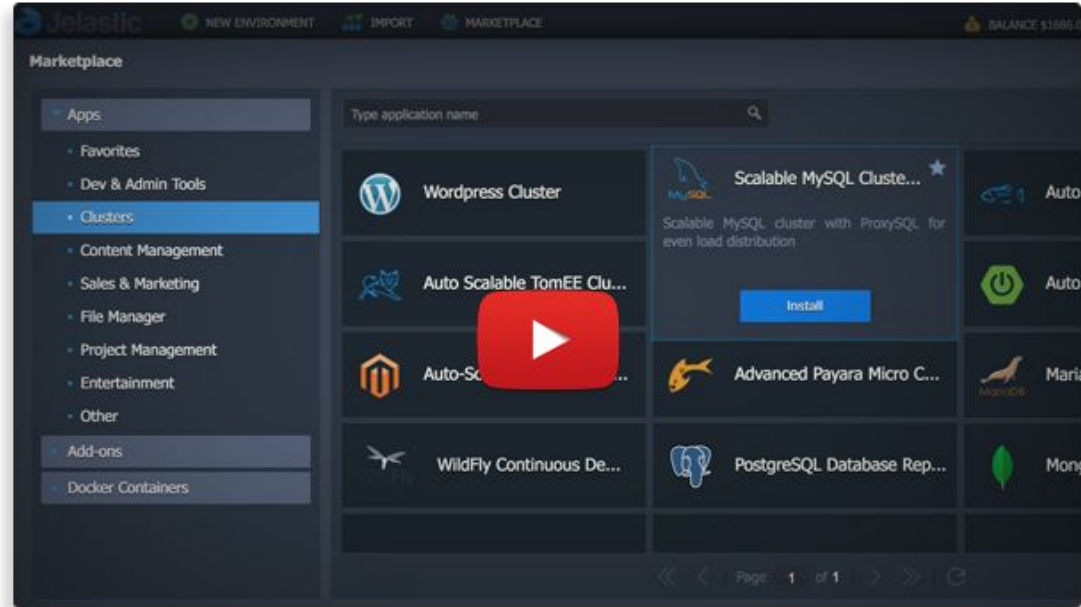

MySQL Auto Clustering

- Master DB
- Slave DB
- ProxySQL
- Orchestrator
- PHP MyAdmin
- Container

Scaling Limits vs Real Usage

Real statistics of defined limits and actually consumed resources

Customers Feedback

We have [reduced our hosting costs by almost 30%](#). Vertical scaling has been one of our main motivations for working with Jelastic. It is undeniable that this simple system allows us today to save money and at the same time cope with peaks in one of the resources (such as during data integration and migration phases). [Simon Lee](#)

One of the core reasons we wanted to switch was mainly the cost to be honest – [we cut our hosting bill by 90%](#). We decided to move from dedicated server setup (5 or 6 servers) and reduce this down to the cloud solution Jelastic, and it has cut our hosting bill tremendously. [Robert Matthams](#)

In the previous solution, we always had to choose the exact size of the environment when setting it up, and we were charged based on the fixed size. Nowadays we just need to choose the boundary conditions, and the invoicing is based on the actual usage of resources. [Esko Kantola](#)

The possibility to get resources automatically after the increased number of requests can prevent any possible downtimes. So it's good to have automatic vertical scaling activated with no influence on the architecture and no extra charge for unused allocated resources. [Marco Kundert](#)

Built-in templates							
Automatic Vertical and Horizontal Scaling							
Java & JEE Support							
Application Marketplace							
Docker Containers Support							
24/7 Support							

Included

Limited capability

Require additional Investment

Not available

Amazon Web Services

Category

Public PaaS

Apps Compatibility

Proprietary API

Languages Supported

Java, .NET, Python, Ruby and Perl

Databases Supported

Oracle, MS SQL, MySQL, RDS

Data centers location

11 countries, including US and Europe

Private cloud

Not available

Support

24/7 starts at **\$100/month**

Differentiators

- AWS Elastic Beanstalk readily supports Java, Python, Ruby, Perl and other languages
- Oracle, MySQL and SQL Server can be set up and managed, but AWS offers RDS web service as well, which eliminates database administration tasks
- Developers have access to various Amazon API service options, from analytics to big data, from mobile to IoT
- Built-in ML services and GPU-powered nodes
- Pre-built Mobile Backend as a Service (MBaaS) capabilities

Cons

- Extremely complex UI
- AWS services can require more management overhead than other PaaS options
- Pricing is very complex: based on instances, storage, application services and data egress charges

Category

Public PaaS, Virtual Private PaaS

Apps Compatibility

Proprietary API

Languages Supported

Java, PHP, Ruby, Node.js, Python, Go and Scala

Databases Supported

PostgreSQL and Redis

Data centers location

Public cloud: Germany & US
VPC in: Japan, Germany & US

Private cloud

Not available

Support

24/7 Starting at \$1000/mo

Differentiators

- Good support of Ruby and Node.js
- Advanced support of PostgreSQL and Redis
- Heroku works best with applications that fit well into the Twelve Factor App methodology
- Ideal for quick deployments and fits a wide range of distributed applications
- Wide variety of third party services/addons that can be installed in a single click

Cons

- High cost, especially at scale, due to use of AWS as underlying infrastructure
- Scalability is not granular (via fixed size dynos)
- Most of the operations have to be performed via CLI tool

Category

Public PaaS, Virtual Private PaaS, Private PaaS

Apps Compatibility

No proprietary API, microservices

Languages Supported

Java, PHP, Ruby, Node.JS & Python

Databases Supported

MySQL, PostgreSQL and MongoDB

Data centers location

AWS EC2, including Asia Pacific, EU, South America, US East, and US West

Private cloud

Available

Support

24/7 included only in **\$48k/y** plan

Differentiators

- Advanced support of Java and Java EE stack, based on RedHat JBoss Platform
- OpenShift focuses on continuous integration and continuous delivery automation as well as on autoscaling of deployed applications
- OpenShift has open source version of the product
- Wide variety of certified containers with different runtime languages, databases and components
- Everything is based on containers and Kubernetes

Cons

- UI is very limited and non-obvious
- You have to be a tech-savvy person to work with it. Your application must implement Kubernetes pattern design
- Public cloud version is not designed for production as it lacks in scalability
- It is a tricky to deploy a custom stack

Google App Engine

Category

Public PaaS

Apps Compatibility

Proprietary API

Languages Supported

Java, PHP, Python, Node.js and Go

Databases Supported

Google Cloud SQL, Blobstore

Data centers location

US and Europe

Private cloud

Not available

Support

24/7 starts at \$400/mo

Differentiators

- Google App Engine is designed for distributed web applications
- Good isolation and automatic horizontal scaling to handle load spikes
- The PaaS offers managed runtime environments that are guaranteed to scale, but only if applications implement specific architecture design
- The Datastore, a transactional, schema-less data store based on key-value pairs, handles the complex management of data that's accessible to multiple machine instances
- Ability to utilize Google's Big Data and ML services
- Ability to utilize

Cons

- UI for PaaS (GAE) is almost absent
- GAE was recently split into GAE standard and Flexible environment
- Support of Java stack is limited
- No persistent storage for the filesystem data

Category

Public PaaS

Apps Compatibility

Proprietary API

Languages Supported

.NET, PHP, Java, Python, Ruby and Node.js

Databases Supported

MS SQL, Blobs, Redis and MongoDB

Data centers location

11 countries, including US and Europe

Private cloud

Available, only as a appliance

Support

24/7 starts at **\$300/month**

Differentiators

- Since Microsoft Azure is an IaaS and PaaS in one, developers can mix and match IaaS components with PaaS offerings giving you more control
- Developers has access to various Microsoft API service options, from predictive analytics to big data
- Pre-built Mobile Backend as a Service (MBaaS) capabilities
- Good support of .NET/ASP.NET technologies from its vendor
- Managed SQL Server

Cons

- Applications are administered through the Microsoft Azure dashboard or through a CLI/API because of minimalist administration portal
- Private cloud option is limited, but generally possible only with IaaS (AzurePack)
- AzureStack (PaaS) is available only as a hardware appliance and starts at \$240,000 one-time & \$5000/mo for support

Category

Public PaaS, Virtual Private PaaS and Private PaaS

Apps Compatibility

Proprietary API

Languages Supported

Java, PHP, Python, Node.js, Ruby and Go

Databases Supported

DB2, Postgres, Redis, MongoDB and ClearDB

Data centers location

US and Europe

Private cloud

Available, but only managed

Support

24/7 starts at \$200/mo

Differentiators

- IBM Bluemix is a PaaS based on CloudFoundry technology and hosts on the SoftLayer infrastructure
- Developer has access to various IBM and 3-rd party service options, from predictive analytics to big data
- Bluemix also provides pre-built Mobile Backend as a Service (MBaaS) capabilities
- Possibility to deploy CloudFoundry runtimes, IBM containers, OpenStack VMs; integrate other demanded services (IBM, 3-rd party, community) and APIs
- Granular resource scaling

Cons

- Necessity to change application's code to deploy it to the cloud
- Deployment via GIT or CLI only
- Bluemix Dedicated and Local are always manageable by IBM
- Private cloud option is very expensive

Category

Public/Private PaaS

Apps Compatibility

No proprietary API, legacy applications, microservices

Languages Supported

Java, .NET, PHP, Ruby, Node.JS, Python

Databases Supported

MySQL, MariaDB, Neo4j, PostgreSQL, MongoDB, Cassandra, Redis, MSSQL

Data centers location

28 countries in Europe, North and South America, Asia, Africa and Australia

Private cloud

Available, both managed & unmanaged

Support

24/7 for FREE

Differentiators

- Most advanced Java and JavaEE support
- Easy migration from legacy infrastructure to the cloud with zero code changes
- Spike loads handling with automatic vertical and horizontal scaling
- Local support and storing sensitive data according to local regulations within hosting partners ecosystem around the world
- No lock-in and TCO optimization with on and off premise installation on bare metal hardware or any IaaS
- Advanced self-service portal for developers
- Orchestration availability, cloud scripting

Cons

- .NET support is not so advanced as at MS Azure (in the roadmap)
- Multi-cloud is implemented using multi-provider approach (in the roadmap)
- No support of Kubernetes (in the roadmap)
- Tricky backup and restore (BaaS in the roadmap)
